Numina Data Dictionary

Field Name	Data Type	Description	Example
zone_id	string	The unique identifier for a behavior zone. A behavior zone is a spatial region defined on a Numina sensor device's field of view, used for filtering and analysis of street-level movement.	‘52116’
metric	string	A metric (e.g. count) representing aggregate object behavior for objects of a given object class, device (feed), and time interval. (e.g. pedestrian counts for device 1 at the time interval starting on 2019-01-01T00:00:00)	‘count’
objClass	string	The classification of a discrete object detected by a Numina sensor. Typical objects detected by a Numina sensor include pedestrians, bicyclists, cars, buses, trucks.	‘pedestrian’
result	string	Compute object counts for all objects with type in obj_classes that intersect with the given BehaviorZones over a time range, grouped by interval. The result of the specific query used to create the report. In this case, the number of objects detected by the sensor that passed through zone_id 52116.	‘276’
time	string	The timestamp for the end of each query interval, in ISO format.	‘2020-07-13T14:00:00-04:00’
